

The project consisted of a Fitness club on 3 levels of an existing retail space. BCSI parent Company was hired by the GC to perform Post-Tensioning alterations for the creation of two new mechanical stairs slab openings and the enlargement of one staircase in a concrete slab post-tensioned with an unbonded monostrand system. Works were phased to avoid need for shoring and work was completed timely to the satisfaction of all team members. We were called twice for Post-Tensioning repairs of strands found broken or cut accidentally while drilling for plumbing penetrations for the new construction.
